Description Hello, I recently discovered, that strongSwan 5.1.2 (and maybe newer versions) correctly detect the eap identity during authentication, but don't seem to be able to switch to another conn after that. Is that a bug or a missing feature? I haven't found anything about that on the road map. The EAP authentication method in use is EAP-MSCHAPV2. If required, I will provide an example conn and a log. Kind regards, Noel

Just for reference, there is a workaround (besides using RADIUS and group matching) I described in [this answer on serverfault.com](https://serverfault.com/questions/1011183/eap-identity-switching-between-connections).
