In the Android client, currently, the identity used for "leftid" is the full DN of the certificate used. However it would be useful to have a choice here to either:
- Use full DN (current behavior)
- Take the SubjAltName EMAIL if it exists.
- Specify one

I'm not sure how much sense it makes to set an identity that is not confirmed by the certificate, so the GUI currently provides no option to freely configure a local identity.
