<b>Description</b>			
It would be great to have a command like "ipsec stroke add" that only adds the connection using the name, parsing the parameters from the command line. This will help to enable/disable conns on demand.

With the new [vici](#) plugin provides an interface to use for configuration management. While [swanctl](#) currently reads connection definitions from files only, a custom/auxiliary tool can be implemented easily to provide this functionality.

I'm closing the ticket for now, feel free to reopen if the provided functionality is insufficient.
